

# Marine Electrical Power

RELIABILITY AND QUALITY

Enjoy consistent reliable power and lighting, without changeover blackouts and power quality problems.

Custom designed systems co-ordinating and controlling your generator, inverter and batteries.

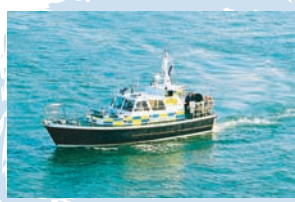

## 24 hour power

The first thing in a Stream Marine system is the design quality and attention to detail.

Innovative design, lateral thinking, and integration of the different disciplines combine to give tidy and near silent systems that go on working reliably.

Slow revving silenced water cooled generators, linked and connected inverters & chargers and sealed gel type batteries for high discharge - only needs an engineer's check once a year.

Enjoy uninterrupted operation of your systems and appliances; generator, inverters and batteries work together so you can forget it - just relax and enjoy!

**Power Solutions**

- 120 volt 60 Hz shore power? - **no problem!**
- noisy generators? - **no problem** (as quiet as 20dBA)!
- Forget to start the set? - with AutoStart & Run it's **no problem!**

## Integrated Systems

### Air Conditioning Electrical Power

Many smaller boats require more electrical power for cooling and heating than for other uses - it makes sense to specify a combined generation and climate control system.

Design, supervision and installation assistance is available to co-ordinate with your fitters and in house design & engineering staff.

We operate trailable workboats to access your moorings and to evaluate the products we endorse.

Smaller vessels can also benefit from combining alternator, wind/solar charging and inverters & batteries.

On a Mooring?  
We come to you!
